

## NODE4: Magellan's Voyage

### Objective

Create a site that takes the user on a virtual tour of Magellan's voyage circumnavigating the globe. Each page is a separate stop on the voyage.

### Requirements

#### Part I

1. The user should start on the home page at Seville, where Magellan departed Spain in 1519.
2. Create a separate page for each of the following locations from Magellan's expedition:
  - Seville
  - Canary Islands
  - Cape Verde

- Strait of Magellan
  - Guam
  - Philippines
3. At each location (except the last), a next button should lead the user to a new page with information about that stop on Magellan's voyage.

## Bonus

1. Add a route to handle an unknown destination. For example, if the user requests a page for "India", the user should see a simple page that informs the user that Magellan did not travel to India. (See [Application Routing](#) in the Express documentation for a description of different types of dynamic routes.)
2. Add a /next route which will serve up a JSON response that tells the user what location comes after a given location.
  - The route should take a query string of the current location e.g.  
`/next?location=Seville`.
  - Return a JSON response that looks like the following:
  - ```
{  
  location: 'Seville',  
  nextLocation: 'Canary Islands'  
}
```
